

TEST

Set up a REST api for witness reports. The client sends a name related to the case and a phone number on which they can be contacted for more details.

We need to store all the reports in a file, and we should check the validity of the report.

- a) First by checking if there actually is a case with that title in the FBI DB. You can use the open FBI Most Wanted API: <https://www.fbi.gov/wanted/api>
- b) Second, we should check the validity of the phone number
- c) Check and record in the report the country of the client. This can be deducted from their phone number and/or ip address

For phone number validation you can use

- <https://github.com/google/libphonenumber> and

for IP geolocation maybe

- <https://geo.ipify.org/> or any similar services
